Chapter 12. Vasodilators & the Treatment of Angina Pectoris

Bertram G. Katzung, MD, PhD¹

The author thanks Dr. Kanu Chatterjee, MB, FRCP, who was coauthor of this chapter in prior editions.

– Case Study

A 74-year-old man presents with a history of anterior chest pressure whenever he walks more than one block. The chest discomfort is diffuse, and he cannot localize it; sometimes it radiates to his lower jaw. The discomfort is more severe when he walks after meals but is relieved within 5–10 minutes when he stops walking. Assuming that a diagnosis of stable effort angina is correct, what medical treatments should be implemented to reduce the acute pain of an attack and to prevent future attacks?

The screenshot displays the AccessMedicine website interface. At the top, the logo 'ACCESS Medicine from McGraw-Hill' is visible with the tagline 'Trusted Content. Instant Answers.' Below the logo, a navigation bar includes links for Home, Readings, Quick Reference, Multimedia, Cases, Self-Assessment, Custom Curriculum, and Patient Ed. A search bar is present with a 'Search' button and an 'Advanced Search' link. A dropdown menu for 'Quick Reference' is open, showing options: Quick Dx & Rx, Guidelines, Algorithms, DDx, Diagnostic Tests (highlighted), and Calculators. The main content area features the cover of the 'Pocket Guide to Diagnostic Tests, 6e' by Diana Nicoll. The book cover is blue and white, showing various medical images and the title 'DIAGNOSTIC TESTS' in large letters. The authors listed are Diana Nicoll, Chuanyi Mark Lu, Michael Pignone, and Stephen J. McPhee. Below the book cover, a table of contents is displayed with two columns of links.

Case 44

A 21-year-old primigravid female at 35-week gestation presents to the hospital with nausea, vomiting, and malaise over the last several days. Patient has also noticed that her eyes were turning yellow in color. Her prenatal course has otherwise been unremarkable. On examination she is found to have elevated blood pressure, proteinuria, increased liver function tests, prolonged clotting studies, hyperbilirubinemia, hypofibrinogenemia, and hypoglycemia. A pelvic ultrasound identified a viable intrauterine pregnancy measuring approximately 35-week gestation. After admission, the mother underwent an emergent cesarean delivery, and she subsequently developed a worsening hypoglycemia and coagulopathy and went into hepatic coma with renal failure. After reviewing all the laboratory results and her clinical picture, the patient was diagnosed with acute fatty liver of pregnancy.

Question 1: Incorrect

A 51-year-old alcoholic man is admitted to the hospital for upper gastrointestinal bleeding. From further history and physical examination, it becomes apparent that his bleeding is from gingival membranes. He is intoxicated and complains of fatigue. Reviewing his chart you find that he had a hemarthrosis evacuated 6 months ago and has been lost to follow-up since then. He takes no medications. Laboratory data show platelets of 250,000 and INR of 0.9. He also has a diffuse hemorrhagic eruption on his legs that is centered around hair follicles. What is the recommended treatment for this patient's underlying disorder?

- ☐ A Folate
- ☒ B Niacin
- ☐ C Thiamine
- ☒ D Vitamin C
- ☐ E Vitamin K
