摘要: The carbon nanotube composite material and its fabrication techniques are introduced to construct a chip-based electrode system for human breath dynamics characterization. The application of 10 V dc bias can generate electric field high enough to effectively collect the charged particles in the human breath. Without using breath collecting tubes, the field tests in the open air exhibit that the system is technologically promising for long-time and noncontact human breath dynamics monitoring, due to its high stability, sensitivity, and safety operation performance with power consumption in the order of 10^{-5} W. (Received 22 October 2004; accepted 13 September 2005; published online 14 October 2005)

Temperature changes induced by externally applied mechanical stress were observed in the $\text{Pb}_3(\text{PO}_4)_2$ ferroelastic crystal. These characteristic features can be explained by the thermoelastic effect as in other thermoelastic martensitic materials. In this study, the mechanical stress dependence of the thermoelastic effect was studied using a modified thermomechanical analysis system. The thermoelastic effect strongly depended on the mechanical stress and was enhanced by ferroelastic domain switching, responsible for the pseudoelastic behavior of ferroelastic materials. The $\partial T / \partial \sigma_{\sin}$, the change of sample temperature with varying stress enhanced by pseudoelasticity, was $\sim 9.5 \times 10^{-2} \text{ }^\circ\text{C}/\text{MPa}$ at $159 \text{ }^\circ\text{C}$, ferroelastic temperature region under 1.2 MPa sinusoidal stress. This value is eight to nine times higher than the values obtained under bias stress. This result can be explained by a thermoelastic equation which includes the effective thermal expansion coefficient in the ferroelastic phase. © 2005 American Institute of Physics. Pressure Ulcers: Complications

Assessment

- ▶ **Patient History**
 - Assess history of chronic illnesses and nutritional status, both ulcer risk factors
- ▶ **Physical Findings of Particular Interest**
 - Measure the parameters of wounds (e.g., dimensions, location, color, presence and consistency) and photograph at least weekly
 - Assess intrinsic (e.g., nutritional status, mobility, incontinence, and neurological dysfunction), extrinsic (e.g., pressure, moisture, and friction) factors, and use of support surfaces to prevent pressure ulcers)
- ▶ **Laboratory Tests That May Be Ordered**
 - Ulcer swab culture may indicate bacterial infection; accurate results are more likely during or after debridement
 - Blood culture and bone biopsy may be positive, indicating osteomyelitis
 - Tumor biopsy tissue analysis may indicate Marjolin's ulcer
 - Elevated WBC count or SED rate may be elevated if infection is present
- ▶ **Other Diagnostic Tests/Studies**
 - Use a pain assessment scale (i.e., McGill Pain Questionnaire, a Visual Analogue Scale, or Face Pain Scale) to assess patient's experience of pain and need for pain medication
 - CT scan, MRI, and bone scintigraphy will determine the stage of Marjolin's ulcer
 - X-rays or CT scan may show bone destruction from osteomyelitis

Treatment Goals

- ▶ **Treat Pressure Ulcer Complications and Monitor for Treatment Efficacy**
 - Assess for pain and other discomfort; administer prescribed oral analgesics for pain, especially
 - Assess ulcer characteristics and photograph; apply topical inflammation inhibitors (e.g., benzoyl peroxide, EMLA Cream [Eutectic Mixture of Local Anesthetics]), as ordered
 - Assess for signs of infection (e.g., exudates [both type and amount], odor, and no evidence of healing)
 - Give systemic antibiotics and apply topical antibiotics or antimicrobials (e.g., silver-based to wound)
 - Select type of dressing, loosely pack wound space, and change dressing as ordered, depending on wound characteristics
 - Suggest referral to wound care specialist if pressure ulcer is resistant to healing, size or drainage increases, or signs of infection develop
- ▶ **Treat Malodor and Exudates and Prevent Additional Complications**
 - Regularly cleanse the wound with normal saline; dress with a hydropolymer dressing that keeps wound moist but prevents maceration of surrounding skin, as ordered
 - Request order for whirlpool treatment for those ulcers that contain thick exudate, slough, or necrotic tissue
- ▶ **Support Emotional Well-Being and Educate**

Description/Etiology

A pressure ulcer (also called bedsore and decubitus ulcer) is a localized injury to the skin and underlying soft tissues caused by unrelieved pressure that impairs blood flow. Pressure ulcers develop from prolonged immobility, which causes the underlying tissue to break down overlying tissue as a result of capillary compression (i.e., pressure on thin skin), and shearing forces (i.e., parallel forces that pull the skin and underlying bones with attached muscle tissue are pulled in opposite directions). People with SCI are particularly at risk for development of pressure ulcers (see *Quick Lesson About...Pressure Ulcers*, P. 5000003911).

Bipolar Disorder in Children and Adolescents

What We Know

- ▶ Bipolar disorder (BD) is a chronic psychiatric disorder characterized by recurrent, alternating episodes of depression and mania. Two types exist: BD I, which is characterized by one or more manic or mixed (symptoms of mania and depression) episodes, usually with a major depressive episode; and BD II, which is characterized by one or more major depressive episodes with at least one mild episode of mania. Episodes usually last for 1 week or more, and four or more episodes (rapid cycling) may occur in a year^(1, 2, 3)
- ▶ **Facts and figures**^(1, 2, 3, 5)

What We Can Do

- ## What We Can Do
- Learn more about BD in children and adolescents, including diagnostic disorders, and treatment; share knowledge with colleagues
 - When conducting psychiatric assessments in children and adolescents, address changes, sleep disturbances, depression, and family history of BD and other disorders, and **risk for suicide**⁽³⁾
 - Provide patient with BD with written information on BD, including
 - Educate patient/family on need for medication, medication side effects
 - Educate the patient and family about the pattern and cycle of BD episodes to help prevent episodes
 - Discuss with family the warning signs of suicide and procedures for intervention
 - Educate patient on cognitive-behavior therapy (CBT) techniques to manage symptoms
 - Discuss need for follow-up with psychiatrist or clinician to monitor symptoms
 - If possible, provide patient/family with local, state, and national resources, including therapists, psychiatrists, substance abuse treatment centers, Alcohol

[SHELLFISH](#)

Section: Cover Story: Medicine

It's 1 p.m. at Mercer Elementary School in Shaker Heights, Ohio, and Lena Paskewitz's kindergarten class is filled with the happy hum of kids getting ready for their favorite part of the day: lunch. Caleigh Leiken, 6, is toting a pink Hello Kitty bag her mom has packed with goodies: strawberry yogurt, string cheese, some veggies and a cookie. But there's one childhood staple missing--a PB&J. Caleigh was diagnosed with a peanut and tree-nut **allergy** when she was just 7 months old. Nuts are a no-no at her table in the Mercer lunchroom. Her **allergy**-free friends can sit there, but only if their lunches have been stored in a special bin and carefully inspected by the teacher. Home, too, is a nut-free zone for Caleigh. When she goes trick-or-treating this week, her candy will be scarier than any costume; she won't be able to eat any of it for fear it's tainted with peanut residue. For Caleigh's mom, Erika Friedman--whose other two kids also have **allergies**--

food can seem like an enemy. "We plan everything," says Friedman. "It's our job--actually, everyone's job--to keep them safe."

There was a time when **food allergies** were of little concern to the medical community. Today about 11 million Americans suffer from them, and many scientists agree the numbers are climbing. Most significantly, peanut **allergies**--among the most dire--doubled between 1997 and 2002 in children under 5. "Clearly, the number has increased in the younger population," says Dr. Hugh Sampson, a **food-allergy** pioneer at Mount Sinai School of Medicine in N.Y. "We suspect that [in the future], the numbers in general are going to increase." Allergists say they're now seeing more children with multiple **allergies** than ever before, not just to 1950s staples such as milk and wheat--but to global **foods** we have adopted since, like sesame and kiwi. And **allergies** many kids outgrow--like those to eggs--seem to be lingering longer than they did in the past.

Parents of very young children now worry over the introduction of each new **food**, on alert for the first signs of trouble, such as rashes, diarrhea and vomiting. Deaths are rare, but the most-sensitive kids' throats may swell and completely close up if they're exposed to the wrong **foods**. Even if your school-age child is **allergy**-free, you still have to be concerned about inadvertently triggering an allergic reaction in one of your kid's friends or classmates. Dairy-free birthday cakes are de rigueur these days, as are no-peanut Halloween parties.

But why do **allergies** appear to be on the rise? One of the most intriguing theories, dubbed the "hygiene hypothesis," is that we've all become too clean. The immune system is designed to battle dangerous foreign invaders like parasites and viruses and infections. But clean water, antibiotics and vaccines have eliminated some of our most toxic challenges. Intriguing research even posits that kids born by Caesarean section, which have risen 40 percent in the last decade, could be at higher risk for **allergies**, perhaps because they were never exposed to healthy bacteria in their mothers' birth canals. Without hard-core adversaries, the theory goes, the immune system starts battling the innocuous--egg or wheat--instead.
